

## Sneakers RTP API

- Use search endpoint to allow user to search by shoe name
  - Display picture from picture link
  - Note down colorway
  - Note down retail price
- Extract sku from returned json and pass sku in to RTP endpoint
  - Allows us to last, min, and avg prices in EUR and USD based on shoe size
  - Sneaker size in US mens by default, maybe have a conversion table displayed or a feature that automatically converts
- One problem: API doesn't provide direct links to products on their respective websites
  - Solutions:
    - We can provide links to homepages of the different websites and have user then search for product
    - Find another api that will provide links to webpages
    - Mock an API that will do so
